1. PTM: Contains a covalently attached chromophore, which is composed of modified amino acid residues. The chromophore is formed upon cyclization of the residues. The chromophore is formed upon cyclization of the residues Ser-dehydrofyr-GP.

1. BIOTECHNOLOGY: Has become useful and ubiquitous tool for making chimmeric proteins of GFP linked to other proteins where it functions as a fluorescent protein tag. GFP tolerates N-and C-terminal fusion to a broad variety of proteins. It has been expressed in Dacteria, yeast, slime mold, plants, Drosophila, zebrafish, and in mammalian cells. As a noninvasive fluorescent marker in living cells, it allows for a wide range of applications where it may function as a cell lineage tracer, reporter of gene expression, or as a measure of protein-protein interactions.

NOTE: Issue il of June 2001;

Structural and spectral response of green fluorescent protein

T variants to changes in pH.";

Blochemistry 38:5296-530(1999).

- !- PUNCTION: Bnergy-transfer acceptor. Its role is to transduce the blue chemiluminescence of the protein aequorin into green fluorescent light by energy transfer. Fluoresces in vivo upon receiving energy from the Ca(2+)-activated photoprotein aequorin. Aksorbance peak at 470 nm. The fluorescence emission spectrum peaks at 590 nm with a shoulder at 540 nm.

- !- SUBUNIT: Monomer.

- I TISSUE SPBEIRICITY: Photocytes.

"The C. elegans vitellogenin genes: short sequence repeats in the
promoter regions and homology to the vertebrate genes.";

"In subclaic Acids Res. 13:5283-5295(1985).

"I- FUNCTION: Precursor of the egg-yolk proteins that are sources of
nutrients during embryonic development (Potential).

"SUBCELLULAR LOCATION: Secreted.

"I SSUB SPECIFICITY: Synthesized in Caenorhabditis only by 32 cells
building the intestine of adult hermaphroditic individuals; they
are cotranalationally secreted into the body cavity and
subsequently taken up by the goand.

"SIMILARITY: Contains 1 VWFD domain.
                                                                                                                                                           Caenorhabditis elegans.

J. Clin. Microbiol. 32:1902-1907(1994).
-! FUNCTION: Catalyzes C14-demethylation of lanosterol which is critical for ergosterol biosynthesis. It transforms lanosterol into 4.4' dimethyl cholesta-8,14,24-triene-3-beta-ol (By Similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CATALYTIC ACTIVITY: Obtusifoliol + 3 O(2) + 3 NADPH = 4-alpha-methyl-5-alpha-ergosta-8,14,24(28)-trien-3-beta-ol + formate +

diphosphate + L-leucyl-tRNA(Leu).
SUBUNIT: Monomer. (By similarity).
SUBCELIULAR LOCATION: Cytoplasmic.
SUBCELIULAR LOCATION: Cytoplasmic.
SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.

-!-CATIALYTIC ACTIVITY: S-adenosyl-L-methionine + tRNA = S-adenosyl-L-hcmocysteine + tRNA containing thymine.
-!-SIMILARITY: Belongs to the RNA M5U methyltransferase family. TrmA

-!- FUNCTION: REQUIRED FOR THE SYNTHEGIS OF OHHL (N-(3-OXOHEXANOYL)-L-HOMOSERINE LACTONE), AN AUTOINDUCER MOLECULE WHICH BINDS TO EXPR AND THUS ACTS IN VIRULANCE (SOFT ROT DISEASE) THROUGH THE ACTIVATION OF GENES FOR PLANT TISSUE MACERATING ENZYMES.
-!- SIMILARITY: Belongs to the autoinducer synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       4 KGEELFTGVVPILVELDGD------VNGHKFSVSGEGEGDATYGKLTLKFICTTGKLP

       ENZYME REGULATION: The activity of this enzyme is controlled by adenylation. The fully adenylated enzyme complex is inactive. SUBUNIT: Oligomer of 12 subunits arranged in the form of two hexagons (By similarity).
SUBCELLULAR LOCATION: Cytoplasmic.
SIMILARITY: Belongs to the glutamine synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               55;

```
The invention relates to a fluorescent protein derived from green fluorescent protein (GFP) or its analogue. The GFP containing mutations at Felf. and E2266 has a bigger compared to other GFP's making it very suitable for high throughput screening due to better resolution. The fluorescent protein is useful in invitro assays for measuring protein kinase activity or dephosphorylation activity, or for measuring protein redistribution. The fluorescent protein tags in transgenic animals, living and fixed cells; organelle tags, secretion marker and genetic reporter. The fluorescent protein is also useful as a cell or organelle integrity marker, a marker for changes in cell morphology, as transfection marker. The fluorescent protein is also useful as a cell or organelle integrity marker, a marker to be used in combination with fluorescence activated cell sorting (FACS). The novel proteins can also be used as reporter to monitor live or dead biomass of organisms, such as fungi. The fluorescent protein is also useful as markers in transcriptional and translational protein for bacterial detection. Transposons encoding the fluorescent protein are useful for screening promoters and for tagging plasmids and as a reporter for bacterial detection. Transposons encoding the fluorescent protein are useful for designing diagnostic tool. The present sequence is a DNA encoding conhanced F64L-E222G jellyfish green fluorescent protein (GFP) mutant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   VNRIELKGIDFKEDGNILGHKLEYNYNSHNVYIMADKQKNGIKVNFKIRHNIEDGSVQLA 180

The invention relates to a novel cell, comprising three heterologous conjugates (HC), a first HC (HC1) comprising an anchor protein that specifically binds to an internal structure within the cell conjugated to an interactor protein (IP) of type A, a second HC (HC2) comprising IP of type B conjugated to a first protein of interest, and a third HC (HC3) comprising a second protein of interest conjugated to detectable group. The cell is useful for detecting if a compound disrupts or induces the interaction between two intracellular proteins. The cell is also useful for screening compounds that modulate the interaction between two intracellular proteins. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                            Novel cell for identifying modulators of protein interaction, contains a first conjugate comprising anchor protein, second conjugate having type B interactor protein and third conjugate with detectable group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                120

The invention relates to determining, if a compound, is a dislocator of PDB4. The method comprises testing if the compound removes PDB4 spots, which may optionally be induced by a Roliprami-like reference compound, and testing if it inhibits the catalytic activity of the PDB4, where the compound is a dislocator of PDB4, if it removes PDB spots and if it does not inhibit the catalytic activity of PDB4. The method is useful for the treatment of diseases of the central dentifying compounds useful for the treatment of diseases of the central nervous system such as joint inflammation, Crohn's diseases of inflammatory bowel disease, respiratory diseases, cronn's disease, inflammatory bowel compound as than, chronic bronchitis, pulmonary disease (CODD), including asthma, chronic bronchitis, pulmonary disease condotoxic shock, toxic shock syndrome, systemic lupus erthematosis, postiaeis, bone resorption diseases, repetitusion injury, cancer and HIV infection. The use of a reagent that can mimic or reverse the effect of the compound with affinity for the catalytic site on intracellular distribution of the PDB for the preparation of a medicament. The present serion can distribution of the PDB for the preparation of a HSPDB4A1-E222G fusion
                                                                                                                              Determining if a compound is a dislocator of PDE4 for identifying compounds for treating CNS and inflammatory disease comprises identifying compounds which remove PDE4 spots.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MVSKGEELFTGVVPILVELDGDVNGHKFSVSGEGEGDATYGKLTLKFICTTGKLDVPWPT 714

The invention relates to determining, if a compound, is a dislocator of PDB4. The method comprises testing if the compound removes PDB4 spots, which may optionally be induced by a Rollpram-like reference compound, and testing if it inhibite the catalytic activity of the PDB4, where the compound is a dislocator of PDB4, if it removes PDE spots and if it does not inhibit the catalytic activity of PDB4. The method is useful for identifying compounds useful for the treatment of diseases such as joint inflammation, cron's disease such as joint inflammation, cron's disease, inflammatory bowel disease, respiratory diseases, chronic obstructive pulmonary disease (ODPD), including asthma, chronic bronchitis, pulmonary emphysema, endotoxic shock toxic shock syndrome, systemic lupus erthematosis, bone resorption diseases, reperfusion injury, cancer and HIV psection. The use of a reagent that can mimic or reverse the effect of the compound with affinity for the catalytic site on intracellular distribution of the PDE for the preparation of a medicament. The present sequence represents the amino acid sequence of a HSPDB4A4-E222G fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .014 VNRIELKGIDFKEDGNILGHKLEYNYNSHNYYIMADKQKNGIKVNFKIRHNIEDGSVQLA 1073
                                                                                                                                                                                                                                                                                     Determining if a compound is a dislocator of PDE4 for identifying compounds for treating CNS and inflammatory disease comprises identifying compounds which remove PDE4 spots.

The invention relates to a fluorescent protein derived from green fluorescent protein (GFP) or its analogue. The GFP containing mutations at F641 and E322G has a bigger compared to other GFP's making it very suitable for high throughput screening due to better resolution. The fluorescent protein is useful in invitro assays for measuring protein kinase activity or dephosphorylation activity, or for measuring protein redistribution. The fluorescent protein is useful in studying cellular functions in living cells, as protein tags in transgenic animals, living and fixed cells; organelle tags, secretion marker and genetic reporter. The fluorescent protein is also useful as a cell or organelle integrity marker, a marker for changes in cell morphology, as transfection marker, and as a marker to be used in combination with fluorescence activated cell systing (FACS). The novel proteins an also be used as reporters to monitor live or dead biomass of organisms, such as fungi. The fluorescent protein as markers in transcriptional and translational fusions for performing transposons encoding the fluorescent protein are useful for screening promoters and for tagging plasmids and chromosomes. The fluorescent protein engineered into the genome of a phage is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel Eluorescent protein in in vitro assay for measuring protein kinase activity or dephosphorylation activity, or for measuring protein redistribution, has a green fluorescent protein with F64L and E222G
                                                                                                                                                               /note= "Wild type Phe substituted with Leu; This corresponds to position 64 in the wild type protein"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 for designing diagnostic tool. The present sequence is enhanced F64L

The invention relates to systems, methods and reagents for cell-based screening or detection of compounds which affect particular biological tunctions. The methods of the invention utilise fluorescent biodetector molecules which, when acted on by a compound of interest, cause an afteration in the cellular distribution of at least the fluorescent context. In one embodiament, the biosensors comprise hear shock proteins a least to a fluorescent protein (e.g., jellyfish green fluorescent protein (e.g., jellyfish green fluorescent protein (e.g., jellyfish green fluorescent proteins can be used to detect protesse activity such protease biodetector proteins can be used to detect protesse activity. Such protease biodetector fusion proteins comprise one or more fluorescent proteins, a recognition signal which is cleaved by the protease; and at least one cellular localisation signal the latter two components may be from heterologous sources. Due to the protease, or may be from heterologous sources. Due to the components of a single protein which is acted upon by the protease of interest, the region of the cell. Once acted on by the protease of interest, the coalisation signal attached from the localisation sequence, and is free to migrate to other locations within the cell. The presence of a second localisation signal attached to a different cellular compartment after cleavage of the protease recognition sequence. The change in distribution of the fluorescent protein of the fluorescent protein of the fluorescent protein compartment after cleavage of the protease recognition sequence in magning methods with a high degree of spatial resolution. The methods and imaging methods with a high degree of spatial resolution. The methods and

```
cellular activities and to screen compounds which modulate these example, may be used for the screening of compounds which modulate these apoptosis, while biosensors containing a recognition site for caspase, for appoptosis, while biosensors containing other protease recognition sites may be used for the detection of proteolytic toxins (such as anthrax candidate compound optimisation by combining many cell screening formats with fluorescence-based molecular reagents and computer-based feature and speed of data analysis and automation, resulting in increased quantity and speed of data collection and faster evaluation of drug candidates. Sequences AAB22881-B22885 represent fluorescent proteins which may used as components of biosensor fusion proteins of the invention

                                                                                                                                                                protein based on the Advance green fluorescent protein (GFP). The emission intensity changes as pH varies between 5 and 10 of the present protein are novel. The functional engineered fluorescent proteins show reversible changes in fluorescence over physiological pH ranges. They can be used for determining the pH of samples and cells. The polymucleotides can also be used to produce transgenic animals. The fluorescent protein pH sensors can be delivered to cells in the form of polymucleotides encoding the protein sensor fused to a targeting signal. The targeting signal directs the expression of the protein sensors to restricted cell locations. This makes it possible to measure the pH of a precisely defined cellular region or organelle
                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

The present sequence is a fluorescnet protein used in the construction of a fluorescent protein indicator. The indicator comprises a sensor polypeptide that is responsive to a chemical, biological, electrical or physiological parameter, and a fluorescence protein functional group. The sensor polypeptide is operatively inserted into the fluorescent moiety. The fluorescent indicator is useful for detecting the presence of a response inducing member in a sample. The method involves contacting the sample with the indicator and detecting a change in fluorescence, in which a change is indicative of the effect of the parameter on the sensor polypeptide. The novel fluorescent proteins are advantageous due to their reduced size as compared to the FRET (fluorescence resonance energy transfer)-based sensors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             121 VNRIELKGIDFKEDGNILGHKLEYNYNSHNVYIMADKQKNGIKVNFKIRHNIEDGSVQLA 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                                                   The present sequence is that of the BGFP signal domain, which can be included in novel recombinant protease biosensors (PBS) of the invention. The PBIS (see AAY79638-54) comprise: a first domain (see AAY79579-87) comprising at least 1 detectable polypeptide signal such as the present sequence; a second domain (see AAY79588-622) comprising at least 1 least the present comprising at least 1 reactant target sequence. A recombinant nucleic comprising at least 1 seactant target sequence. A recombinant nucleic acid (see AAA27627-43) encoding the PB, an expression vector, and a CG acid (see AAA27627-43) encoding the PB, an expression vector, and a cG dentifying engound that modify protease activity in cell involves contacting a host cell that possesses the recombinant PB with a test compound, and determining the PB distribution in the host cell, where CG changes in the distribution of the PB are correlated with modification of protease activity in a host cell include the compounds that modify protease activity in a host cell include the compounds that modify protease activity in a host cell include the crocmbinant nucleic acid, or the recombinant PB, or the vector, or the host cell. The PB is useful in high content screens to detect in vivo activation of enzymatic activity, and to identify specific activity based con cleavage of a known recognition motif
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    VNRIELKGIDFKEDGNILGHKLEYNYNSHNVYIMADKQKNGIKVNFKIRHNIEDGSVQLA 180

The specification describes a method for assessing the growth rate and death rate of a micro-organism within a predetermined time period in a desired environment. The method comprises introducing at least two reporter genes encoding luminescent and/or fluorescent products into the micro-organisms, incubating the micro-organism within the desired environment, and detecting luminescence and/or fluorescence after a predetermined time period. Use of two different markers within a micro-organism enables the differentiation between growth and death rates. The method is used to assess the growth rate and death rate of a micro-organism within a predetermined time period in a desired environment. The present sequence represents a green fluorescent protein (GFP), and is encoded by a plasmid which encodes luminescent and fluorescent proteins, and is used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 LVITLIYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERIIFFKDDGNYKTRAEVKFEGDTL 120

                                                                                                                                                                                                                                                                                                                                                                                      The invention provides melanin concentrating hormone (MCH) receptor (MCHR) chimeric and fusion proteins. The MCHR chimeric proteins comprise MCHR polypeptide regions from different species. The MCHR fusion protein comprise MCHR polypeptide region and a fluorescent polypeptide region of polypeptide region protein solypeptide region. The MCHR fusion proteins can be expressed by standard recombinant methodology. MCH action promotes feeding (orexigenic) and up regulation of MCH activity stimulates food intake. The present sequence represents a A. victoria green fluorescent protein (GFP) and a linker

                                                                                                                              The invention relates to a gene encoding proteins having cyan-green fluorescence characteristic and having a function of showing stable fluorescence characteristic in acid region. A method for the preparation of a cyan-green fluorescent protein is provided which involves a transformant transformed by a recombinant vector comprising the gene, where the transformant is cultured and the protein is collected from the culture. The present sequence represents the A. victoria green fluorescent protein (BGFP)

The invention describes methods of automated detection, classification and identification comprising treating cells containing luminescent containing luminescent reporter molecules (I) in array of locations with a test substance, where (I) are detectors, classifiers or identifiers, imaging cells in each location to obtain luminescent signals and converting optical information into digital data to interpret presence of toxins in the test substance. The method are useful for detection of toxins chosen from proteases, ADP-ribosylating toxins, cytotoxic phospholipases, and exfoliative toxins. Three classes of cell-based luminescent reporter molecules such as detectors, classifiers and identifiers are described and serve as reporters of toxic threat agents. The first two levels of characterisation ensure a rapid readout of toxin class without several complex mixtures of known toxins. This is the amino acid sequence of a protease biosensor related signal sequence used in the cell-based
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            121 VNRIELKGIDFKEDGNILGHKLEYNYNSHNVYIMADKQKNGIKVNFKIRHNIEDGSVQLA 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method for mutagenesis that comprises synthesising a mutated strand and a complementary strand by use of synthesising a mutated basically comprises a DNA synthesis in which one cor more primers that have a nucleotide sequence containing at least one or more primers that have a nucleotide sequence containing at least one mutation and a phosphorylated 5-terminus are annealed to a template DNA and then subjected to an elongation reaction using a thermostable high-containing then subjected terminus are ligated by means of a thermostable high-containing the primers; a digestion in which the stop of DNA synthesis is repeated several lines to amplify the DNA containing the primers and then, at least DNAs other than the amplified circular DNA are digested into several fragments obtained in the step of DNA synthesis in which, with the several fragments obtained in the step of digestion as megaprimers the megaprimers are annealed to the circular DNA synthesised above, followed by an elongation reaction performed using the thermostable high-fidality DNA polymerase. The method is useful for mutagenesis, particularly for introducing centain mutations at certain sites of the nucleotide sequence. The present method is simple, speedy, economical and widely applicable. The present sequence is certain sites of the nucleotide sequence. The present sequence is mutagenesis in an exemplification of the invention. The EGPP used for mutagenesis in an exemplification of the invention. The EGPP is derived intering the green fluorescent protein (GFP) sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     LVTLLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

comprising a phosphorylation polypeptide and a fluorescent protein or in operative linkage, a donor molecule, a phosphorylatable domain, a phosphorylation indicators of the invention an acceptor molecule. The phosphorylation indicators of the invention are useful for detecting kinases or phosphatases in a biological sample. They are also useful in this throughput analysis e.g. for detecting a kinase inhibitor or phosphatase inhibitor. The present sequence is Aequorea victoria enhanced green fluorescent protein (EGFP) used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 3, Application US/09172063
| Sequence 3, Application US/09172063
| Patent No. 6150176
| GENERAL INPORMATION:
| APPLICANT: INPORMATION:
| APPLICANT: Injois, Juan
| APPLICANT: Injois, Juan
| APPLICANT: Remington, S. James
| TITLE OF INVENTION: FLUORESCENT PROTEIN SENSORS FOR
| TITLE OF INVENTION: PLOYERSCENT PROTEIN SENSORS FOR
| TITLE OF INVENTION: WORDSER: US/09/172,063
| TITLE OF INVENTION: WORDSER: US/09/172,063
| CURRENT FILING DATE: 1998-10-13
| EARLIER PILICATION NUMBER: US/09/172,063
| SERVILER PILICATION NUMBER: US/09/172,063
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 239;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 1257; DB 3;
